CHEMOKINE RECEPTOR ANTAGONISTS  
AND METHODS OF USE THEREFOR

RELATED APPLICATIONS

This application is a continuation-in-part of U.S. Serial No. 09/148,515, filed September 4, 1998, which is a 5 continuation -in-part of U.S. Serial No. 09/009,977, filed January 21, 1998, now abandoned, the entire teachings of which are incorporated herein by reference.

BACKGROUND OF THE INVENTION

Chemoattractant cytokines or chemokines are a family 10 of proinflammatory mediators that promote recruitment and activation of multiple lineages of leukocytes and lymphocytes. They can be released by many kinds of tissue cells after activation. Continuous release of chemokines at sites of inflammation mediates the ongoing migration of

effector cells in chronic inflammation. The chemokines characterized to date are related in primary structure. They share four conserved cysteines, which form disulfide bonds. Based upon this conserved cysteine motif, the family is divided into two main branches, designated as the C-X-C 5 chemokines ( $\alpha$ -chemokines), and the C-C chemokines ( $\beta$ -chemokines), in which the first two conserved cysteines are separated by an intervening residue, or adjacent respectively (Baggiolini, M. and Dahinden, C. A., *Immunology Today*, 15:127-133 (1994)).

10 The C-X-C chemokines include a number of potent chemoattractants and activators of neutrophils, such as interleukin 8 (IL-8), PF4 and neutrophil-activating peptide-2 (NAP-2). The C-C chemokines include RANTES (Regulated on Activation, Normal T Expressed and 15 Secreted), the macrophage inflammatory proteins 1 $\alpha$  and 1 $\beta$  (MIP-1 $\alpha$  and MIP-1 $\beta$ ), eotaxin, and human monocyte chemotactic proteins 1-3 (MCP-1, MCP-2, MCP-3), which have been characterized as chemoattractants and activators of monocytes or lymphocytes but do not appear to be 20 chemoattractants for neutrophils. Chemokines, such as RANTES and MIP-1 $\alpha$ , have been implicated in a wide range of human acute and chronic inflammatory diseases including respiratory diseases, such as asthma and allergic disorders.

25 The chemokine receptors are members of a superfamily of G protein-coupled receptors (GPCR) which share structural features that reflect a common mechanism of action of signal transduction (Gerard, C. and Gerard, N.P., *Annu Rev. Immunol.*, 12:775-808 (1994); Gerard, C. and

Gerard, N. P., *Curr. Opin. Immunol.*, 6:140-145 (1994)). Conserved features include seven hydrophobic domains spanning the plasma membrane, which are connected by hydrophilic extracellular and intracellular loops. The majority of the primary sequence homology occurs in the 5 hydrophobic transmembrane regions with the hydrophilic regions being more diverse. The first receptor for the C-C chemokines that was cloned and expressed binds the chemokines MIP-1 $\alpha$  and RANTES. Accordingly, this MIP-1 $\alpha$ /RANTES receptor was designated C-C chemokine 10 receptor 1 (also referred to as CCR-1; Neote, K., et al., *Cell*, 72:415-425 (1993); Horuk, R. et al., WO 94/11504, May 26, 1994; Gao, J.-I. et al., *J. Exp. Med.*, 177:1421-1427 (1993)). Three receptors have been characterized which bind and/or signal in response to RANTES: CCR3 mediates 15 binding and signaling of chemokines including eotaxin, RANTES, and MCP-3 (Ponath et al., *J. Exp. Med.*, 183:2437 (1996)), CCR4 binds chemokines including RANTES, MIP-1 $\alpha$ , and MCP-1 (Power, et al., *J. Biol. Chem.*, 270:19495 (1995)), and CCR5 binds chemokines including MIP-1 $\alpha$ , 20 RANTES, and MIP-1 $\beta$  (Samson, et al., *Biochem.* 35: 3362-3367 (1996)). RANTES is a chemotactic chemokine for a variety of cell types, including monocytes, eosinophils, and a subset of T-cells. The responses of these different cells may not all be mediated by the same receptor, and it is 25 possible that the receptors CCR1, CCR4 and CCR5 will show some selectivity in receptor distribution and function between leukocyte types, as has already been shown for CCR3 (Ponath et al.). In particular, the ability of RANTES to induce the directed migration of monocytes and a memory

population of circulating T-cells (Schall, T. et al., *Nature*, 347:669-71 (1990)) suggests this chemokine and its receptor(s) may play a critical role in chronic inflammatory diseases, since these diseases are characterized by destructive infiltrates of T cells and 5 monocytes.

Many existing drugs have been developed as antagonists of the receptors for biogenic amines, for example, as antagonists of the dopamine and histamine receptors. No successful antagonists have yet been developed to the 10 receptors for the larger proteins such as chemokines and C5a. Small molecule antagonists of the interaction between C-C chemokine receptors and their ligands, including RANTES and MIP-1 $\alpha$ , would provide compounds useful for inhibiting harmful inflammatory processes "triggered" by receptor 15 ligand interaction, as well as valuable tools for the investigation of receptor-ligand interactions.

#### SUMMARY OF THE INVENTION

It has now been found that a class of small organic molecules are antagonists of chemokine receptor function 20 and can inhibit leukocyte activation and/or recruitment. An antagonist of chemokine receptor function is a molecule which can inhibit the binding and/or activation of one or more chemokines, including C-C chemokines such as RANTES, MIP-1 $\alpha$ , MCP-2, MCP-3 and/or MCP-4 to one or more chemokine 25 receptors on leukocytes and/or other cell types. As a consequence, processes and cellular responses mediated by chemokine receptors can be inhibited with these small organic molecules. Based on this discovery, a method of

- 5 -

treating a subject with a disease associated with aberrant leukocyte recruitment and/or activation is disclosed as well as a method of treating a disease mediated by chemokine receptor function. The method comprises administering to a subject in need of treatment an effective amount of a compound or small organic molecule which is an antagonist of chemokine receptor function. Compounds or small organic molecules which have been identified as antagonists of chemokine receptor function are discussed in detail herein below, and can be used for the manufacture of a medicament for treating or for preventing a disease associated with aberrant leukocyte recruitment and/or activation. The invention also relates to the disclosed compounds and small organic molecules for use in treating or preventing a disease associated with aberrant leukocyte recruitment and/or activation. The invention also includes pharmaceutical compositions comprising one or more of the compounds or small organic molecules which have been identified herein as antagonists of chemokine function and a suitable pharmaceutical carrier. The invention further relates to novel compounds which can be used to treat an individual with a disease associated with aberrant leukocyte recruitment and/or activation and methods for their preparation.

## DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to small molecule compounds which are modulators of chemokine receptor function. In a preferred embodiment, the small molecule compounds are antagonists of chemokine receptor function.

5 Accordingly, processes or cellular responses mediated by the binding of a chemokine to a receptor can be inhibited (reduced or prevented, in whole or in part), including leukocyte migration, integrin activation, transient increases in the concentration of intracellular free

10 calcium  $[Ca^{++}]_i$ , and/or granule release of proinflammatory mediators.

The invention further relates to a method of treatment, including prophylactic and therapeutic treatments, of a disease associated with aberrant leukocyte 15 recruitment and/or activation or mediated by chemokines or chemokine receptor function, including chronic inflammatory disorders characterized by the presence of RANTES, MIP-1 $\alpha$ , MCP-2, MCP-3 and/or MCP-4 responsive T cells, monocytes and/or eosinophils, including but not limited to diseases 20 such as arthritis (e.g., rheumatoid arthritis), atherosclerosis, arteriosclerosis, ischemia/reperfusion injury, diabetes mellitus (e.g., type 1 diabetes mellitus), psoriasis, multiple sclerosis, inflammatory bowel diseases such as ulcerative colitis and Crohn's disease, rejection 25 of transplanted organs and tissues (i.e., acute allograft rejection, chronic allograft rejection), graft versus host disease, as well as allergies and asthma. Other diseases associated with aberrant leukocyte recruitment and/or activation which can be treated (including prophylactic

treatments) with the methods disclosed herein are inflammatory diseases associated with Human Immunodeficiency Virus (HIV) infection, e.g., AIDS associated encephalitis, AIDS related maculopapular skin eruption, AIDS related interstitial pneumonia, AIDS related 5 enteropathy, AIDS related periportal hepatic inflammation and AIDS related glomerulo nephritis. The method comprises administering to the subject in need of treatment an effective amount of a compound (i.e., one or more compounds) which inhibits chemokine receptor function, 10 inhibits the binding of a chemokine to leukocytes and/or other cell types, and/or which inhibits leukocyte migration to, and/or activation at, sites of inflammation.

The invention further relates to methods of antagonizing a chemokine receptor, such as CCR1, in a 15 mammal comprising administering to the mammal a compound as described herein.

According to the method, chemokine-mediated chemotaxis and/or activation of pro-inflammatory cells bearing receptors for chemokines can be inhibited. As used herein, 20 "pro-inflammatory cells" includes but is not limited to leukocytes, since chemokine receptors can be expressed on other cell types, such as neurons and epithelial cells.

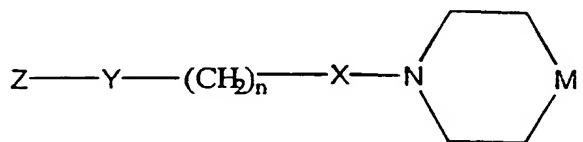

While not wishing to be bound by any particular theory or mechanism, it is believed that compounds of the 25 invention are antagonists of the chemokine receptor CCR1, and that therapeutic benefits derived from the method of the invention are the result of antagonism of CCR1 function. Thus, the method and compounds of the invention can be used to treat a medical condition involving cells

- 9 -

which express CCR1 on their surface and which respond to signals transduced through CCR1, as well as the specific conditions recited above.

The compounds disclosed herein can be obtained as different stereoisomers (e.g., diastereomers and enantiomers). For example, when the antagonist of chemokine receptor function is represented by Structural 20 Formula (I) and Z is represented by Structural Formula (IV), the carbon atom in Ring C which is bonded to Y may be in the R or S stereoconfiguration. It is pointed out that the invention includes all isomeric forms and racemic mixtures of the disclosed compounds and a method of 25 treating a subject with both pure isomers and mixtures thereof, including racemic mixtures. It is understood that one stereoisomer may be more active than another. The desired isomer can be determined by screening for activity, employing the methods described herein.

In the structural formulas depicted herein, the single or double bond by which a chemical group or moiety is connected to the remainder of the molecule or compound is indicated by the following symbol:

5 For example, the corresponding symbol in Structural Formula (V) or (VIII) indicates that the tricyclic ring system, which represents Z in Structural Formula (I), is connected to the alkylene group in Structural Formula (I) by a single covalent bond between the alkylene group and the ring  
10 carbon in Ring C which is bonded to W.

A "subject" is preferably a bird or mammal, such as a human, but can also be an animal in need of veterinary treatment, e.g., domestic animals (e.g., dogs, cats, and the like), farm animals (e.g., cows, sheep, fowl, pigs, horses, and the like) and laboratory animals (e.g., rats, mice, guinea pigs, and the like).

An "effective amount" of a compound is an amount which results in the inhibition of one or more processes mediated by the binding of a chemokine to a receptor in a subject  
20 with a disease associated with aberrant leukocyte recruitment and/or activation. Examples of such processes include leukocyte migration, integrin activation, transient increases in the concentration of intracellular free calcium  $[Ca^{2+}]_i$  and granule release of proinflammatory mediators. Alternatively, an "effective amount" of a compound is a quantity sufficient to achieve a desired  
25 therapeutic and/or prophylactic effect, such as an amount

which results in the prevention of or a decrease in the symptoms associated with a disease associated with aberrant leukocyte recruitment and/or activation.

The amount of compound administered to the individual will depend on the type and severity of the disease and on

5 the characteristics of the individual, such as general health, age, sex, body weight and tolerance to drugs. It will also depend on the degree, severity and type of disease. The skilled artisan will be able to determine appropriate dosages depending on these and other factors.

10 Typically, an effective amount of the compound can range from about 0.1 mg per day to about 100 mg per day for an adult. Preferably, the dosage ranges from about 1 mg per day to about 100 mg per day. An antagonist of chemokine receptor function can also be administered in combination

15 with one or more additional therapeutic agents, e.g. theophylline,  $\beta$ -adrenergic bronchodilators, corticosteroids, antihistamines, antiallergic agents, immunosuppressive agents (e.g., cyclosporin A, FK-506, prednisone, methylprednisolone) and the like.

20 The compound can be administered by any suitable route, including, for example, orally in capsules, suspensions or tablets or by parenteral administration. Parenteral administration can include, for example, systemic administration, such as by intramuscular,

25 intravenous, subcutaneous, or intraperitoneal injection. The compound can also be administered orally (e.g., dietary), topically, transdermally, by inhalation (e.g., intrabronchial, intranasal, oral inhalation or intranasal drops), or rectally, depending on the disease or condition

to be treated. Oral or parenteral administration are preferred modes of administration.

The compound can be administered to the individual in conjunction with an acceptable pharmaceutical or physiological carrier as part of a pharmaceutical

5 composition for treatment of HIV infection, inflammatory disease, or the other diseases discussed above.

Formulation of a compound to be administered will vary according to the route of administration selected (e.g., solution, emulsion, capsule). Suitable carriers may

10 contain inert ingredients which do not interact with the compound. Standard pharmaceutical formulation techniques can be employed, such as those described in Remington's Pharmaceutical Sciences, Mack Publishing Company, Easton, PA. Suitable pharmaceutical carriers for parenteral

15 administration include, for example, sterile water, physiological saline, bacteriostatic saline (saline containing about 0.9% mg/ml benzyl alcohol), phosphate-buffered saline, Hank's solution, Ringer's-lactate and the like. Methods for encapsulating compositions (such as in a  
20 coating of hard gelatin or cyclodextran) are known in the art (Baker, et al., "Controlled Release of Biological Active Agents", John Wiley and Sons, 1986).

The activity of compounds of the present invention can be assessed using suitable assays, such as receptor binding  
25 assays and chemotaxis assays. For example, as described in the Exemplification Section, small molecule antagonists of RANTES and MIP-1 $\alpha$  binding have been identified utilizing THP-1 cells which bind RANTES and chemotax in response to RANTES and MIP-1 $\alpha$  as a model for leukocyte chemotaxis.

Specifically, a high through-put receptor binding assay, which monitors  $^{125}\text{I}$ -RANTES and  $^{125}\text{I}$ -MIP-1 $\alpha$  binding to THP-1 cell membranes, was used to identify small molecule antagonists which block binding of RANTES and MIP-1 $\alpha$ . Compounds of the present invention can also be identified 5 by virtue of their ability to inhibit the activation steps triggered by binding of a chemokine to its receptor, such as chemotaxis, integrin activation and granule mediator release. They can also be identified by virtue of their ability to block RANTES and MIP-1 $\alpha$  mediated HL-60, T-cell, 10 peripheral blood mononuclear cell, and eosinophil chemotactic response.

Example 60 - Membrane Preparations for Chemokine Binding  
and Binding Assays

Membranes were prepared from THP-1 cells (ATCC  
#TIB202). Cells were harvested by centrifugation, washed  
10 twice with PBS (phosphate-buffered saline), and the cell  
pellets were frozen at -70 to -85°C. The frozen pellet was  
thawed in ice-cold lysis buffer consisting of 5 mM HEPES  
(N-2-hydroxyethylpiperazine-N'-2-ethane-sulfonic acid) pH  
7.5, 2 mM EDTA (ethylenediaminetetraacetic acid), 5 µg/ml  
15 each aprotinin, leupeptin, and chymostatin (protease  
inhibitors), and 100 µg/ml PMSF (phenyl methane sulfonyl  
fluoride - also a protease inhibitor), at a concentration  
of 1 to 5 x 10<sup>7</sup> cells/ml. This procedure results in cell  
lysis. The suspension was mixed well to resuspend all of  
20 the frozen cell pellet. Nuclei and cell debris were  
removed by centrifugation of 400 x g for 10 minutes at 4°C.  
The supernatant was transferred to a fresh tube and the  
membrane fragments were collected by centrifugation at  
25,000 x g for 30 minutes at 4°C. The supernatant was  
25 aspirated and the pellet was resuspended in freezing buffer  
consisting of 10 mM HEPES pH 7.5, 300 mM sucrose, 1 µg/ml  
each aprotinin, leupeptin, and chymostatin, and 10 µg/ml

PMSF (approximately 0.1 ml per each  $10^8$  cells). All clumps were resolved using a minihomogenizer, and the total protein concentration was determined using a protein assay kit (Bio-Rad, Hercules, CA, cat #500-0002). The membrane solution was then aliquoted and frozen at -70 to -85°C 5 until needed.

Binding Assays utilized the membranes described above. Membrane protein (2 to 20  $\mu$ g total membrane protein) was incubated with 0.1 to 0.2 nM  $^{125}$ I-labeled RANTES or MIP-1 $\alpha$  with or without unlabeled competitor (RANTES or MIP-1 $\alpha$ ) or 10 various concentrations of compounds. The binding reactions were performed in 60 to 100  $\mu$ l of a binding buffer consisting of 10 mM HEPES pH 7.2, 1 mM CaCl<sub>2</sub>, 5 mM MgCl<sub>2</sub>, and 0.5% BSA (bovine serum albumin), for 60 min at room temperature. The binding reactions were terminated by 15 harvesting the membranes by rapid filtration through glass fiber filters (GF/B or GF/C, Packard) which were presoaked in 0.3% polyethyleneimine. The filters were rinsed with approximately 600  $\mu$ l of binding buffer containing 0.5 M NaCl, dried, and the amount of bound radioactivity was 20 determined by scintillation counting in a Topcount beta-plate counter.

The activities of test compounds are reported in the Table below as IC<sub>50</sub> values or the inhibitor concentration required for 50% inhibition of specific binding in receptor 25 binding assays using  $^{125}$ I-RANTES or  $^{125}$ MIP-1 $\alpha$  as ligand and THP-1 cell membranes. Specific binding is defined as the total binding minus the non-specific binding; non-specific

- 50 -

binding is the amount of cpm still detected in the presence of excess unlabeled RANTES or  $^{125}\text{MIP-1}\alpha$ .

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 99/01367

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: 1-46, 81, 90  
because they relate to subject matter not required to be searched by this Authority, namely:  
**Remark:** Although claims 1-46, 81, 90  
are directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2.  Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
